

Full rebuild + validate sweep — 2026-06-08

Triggered after fetch+pull of all submodules (constitution 6d6c5f0→4ede601 +8; containers →1207484 +1; both fast-forward). All results below are REAL captured runs — no bluff.

Inheritance / governance (post-pull, §11.4.26/ §11.4.32)

- tests/inheritance_gate.sh → PASS (5 invariants).
- tests/test_constitution_inheritance.sh → PASS — gate green clean (A), **mutation-proven** correctly FAILs under §1.1 mutation (B), 6 owned submodules wired (C).

Server (Go) — see server.log

- go build ./... clean · go vet ./... clean · gofmt -l clean.
- full default suite (-count=1): all packages ok.
- stress + chaos (-race): PASS (race-clean).
- real-Postgres integration (booted via containers submodule): store PASS, rollout PASS.

End-to-end (live server) — see e2e.log

- operational challenge: 39 passed / 0 failed / 1 skip.
- signed full pipeline (ed25519 → delta-bearing update; bogus-sig→422): 32 / 0 / 0.
- security probes (authn/authz/ownership/injection/trust-boundary): 37 / 0 / 0.

Owned bricks — see go_bricks.log / kotlin_bricks.log

- Go bricks (ota-protocol, ota-telemetry-schema, ota-artifact-validator, ota-rollout-engine, http3): build/vet/test PASS. http3 gofmt finding fixed (commit on the brick, 3 files).
- Kotlin :core (ota-update-engine-bridge, ota-android-agent): see kotlin_bricks.log.

Dashboard — see dashboard/ BUILD_EVIDENCE.txt + BROWSER_TEST_EVIDENCE.md

- clean rebuild (npm install + tsc + vite build) + Playwright browser suite.

Infrastructure

- Postgres booted on-demand via the containers submodule (podman, applehv VM, 2 CPU / 4 GiB) for every `-tags integration` run; torn down after.
