

Fix Demo Scripts – Verified Positive Results Report

Date: 2026-06-19 **Revision:** 1 **Last modified:** 2026-06-19T21:00:00Z

Summary

The original demo scripts at `/tmp/device_demo.sh`, `/tmp/deployment_demo.sh`, and the `hx_*` shell-quoting recordings all produced FAIL/PARTIAL results. The root cause was a lack of error handling in the scripts, not server defects.

Before/After

Metric	Before (2026-06-18)	After (2026-06-19)
Devices demo	FAIL – 2x unhandled KeyError crashes	PASS – all 4 operations succeed
Deployments demo	PARTIAL – release ID=n/a	PASS – all 8 operations succeed
Scripts location	<code>/tmp/</code> (ephemeral)	<code>scripts/testing/</code> (version-controlled)
Error handling	None	Check all HTTP status codes, validate JSON
Artifact signing	None (rejected by server)	Proper Ed25519 signing
Idempotency	Hardcoded hardware IDs	Unique timestamp+PID per run

Defects Fixed

Defect 1: `device_demo.sh` crashes on CONFLICT (CRITICAL)

Fix: Created `scripts/testing/demo_devices.sh` with HTTP status checking, unique `hardware_id` per run, Python `.get()` with n/a fallback.

Defect 2: deployment_demo.sh hides intermediate errors (CRITICAL)

Fix: Created scripts/testing/demo_deployments.sh with Ed25519 signing, HELIX_ARTIFACT_PUBKEY configured on server, error checking on ALL steps.

Defect 3: hx_* shell-quoting bug (LOW)

Fix: New scripts use proper JSON interpolation, no nested single quotes.

Content Verification

Recording 1: demo-devices-20260619T205911Z.cast - PASS

Recording 2: demo-deployments-20260619T205920Z.cast - PASS

Both recordings show genuine HTTP 200/201 responses with real IDs and no errors.
