

Distribute helixtrack-core to thinker.local — REAL deploy result

Result: GREEN (container running + serving + /health 200). Healthcheck path misconfig surfaced (helix_ota-owned).

helix_track fixes (committed + pushed to Core.git)

1. Dockerfile golang base 1.22-alpine -> 1.24-alpine (go.mod requires go 1.24 / toolchain go1.24.9). commit 3c62217.
2. Restored entity models + priority handler gutted by prior commits 3a5f9e5 / 411e6ec. commit 3483699.

Build: GREEN on thinker (podman-compose build, CGO go build exit 0). Image localhost/containers_helixtrack-core:latest (300 MB).

Runtime evidence (REAL):

- podman ps: helixtrack-core Up (running), helixtrack-postgres Up (healthy)
- GET http://localhost:8080/health -> HTTP 200 {"status":"ok"} (Content-Type application/json)
- app log: "Network discovery service started" on 0.0.0.0:8080; requests served live.
- "unhealthy" status = compose healthcheck probes "/" (404) not "/health" (200) — app is genuinely healthy; healthcheck DEFINITION is the bug (helix_ota containers/compose.helixtrack.yml — conductor-owned).

See deploy.log, build.log, build2.log, up.log, health.log, podman_ps.txt, health_response.txt.
