

OTA-Manager — OpenDesign Token Vending + Theme-Toggle Fix — EVIDENCE

Revision: 2 **Last modified:** 2026-07-09T23:30:00Z **Scope:** clients/ota-manager/ only (per task guardrails). Dashboard NOT touched by this track. **Authority:** executes docs/research/ opendesign_vendoring_plan_20260709/VENDORING_PLAN.md §1. **Anti-bluff (§11.4/§11.4.170):** every claim below is backed by a captured artifact in this directory.

1. Files changed (ota-manager scope)

File	Change
src/styles/opendesign-tokens.css	NEW — byte-identical vendor of design-systems/helix-ota/tokens.css (184 lines, provenance header preserved, cmp == IDENTICAL, zero value edits).
src/index.css	+1 line — @import "../styles/opendesign-tokens.css"; inserted immediately after @import "tailwindcss"; and before the shadcn :root { block, so shadcn's HSL --accent/--muted/--border win the 3 name collisions at equal specificity via later source order. tailwind-v4.css deliberately NOT vendored (would collide with shadcn Tailwind utilities).
src/stores/ui-store.ts	+30/-4 — added module-level applyThemeClass(theme) (remove light+dark, add the theme class, set data-theme); called from setTheme, toggleTheme, and onRehydrateStorage. This is THE BUG fix (store previously never wrote the DOM).
src/main.tsx	+6 — first-paint applier useUiStore.getState().setTheme(useUiStore.getState().theme) after import "../index.css" to avoid FOUC before persist rehydrate. NOTE (§11.4.6 accuracy): with synchronous localStorage, zustand-persist rehydrates during create(), so applyThemeClass also fires from onRehydrateStorage at startup — i.e. it applies twice on load. This is harmless:

File	Change
	applyThemeClass is idempotent (remove-both → add-one → set-attr), so the final DOM state is identical regardless of apply count.
src/stores/ ui- store.test.ts	NEW — jsdom unit test proving the store now writes the DOM class (the harness bypasses the store).

git diff --stat (source): index.css 1+, main.tsx 6+, ui-store.ts 30+/
4- = 3 files, 33 insertions, 4 deletions + 2 new files.

2. pnpm build result — and R5 verdict (pnpm-build.log)

```
vite v6.4.3 building for production...
✓ 1865 modules transformed.
dist/assets/index-BYTkE0vB.css 47.26 kB | gzip: 8.71 kB
dist/assets/index-PMTY-XlK.js 571.33 kB | gzip: 181.38 kB
✓ built in 2.28s
BUILD_EXIT=0
```

Result: PASS (exit 0). The 500 kB chunk-size line is a pre-existing informational warning, not an error.

R5 (UNCONFIRMED: Tailwind-v4 config-loading) — RESOLVED to CONFIRMED-OK. Post-build inspection of the emitted CSS: - OpenDesign layer resolved & present: `grep --surface-warm dist/assets/*.css → 1 match; --accent:#2563eb present`. The added import loaded (no build error, variables emitted). - shadcn/Tailwind-v4 utilities still emit: 583 matches for `bg-background/.text-muted-foreground/--tw-*; hsl(var(--border` still present. The v4 back-compat auto-detection of the root `tailwind.config.ts` by `@tailwindcss/vite` continues to work with the new import in place.

3. §11.4.170 host-render dual-oracle — BOTH themes (hostrender.log, hostrender-results.json)

Command: `pnpm hostrender` → `HOSTRENDER_EXIT=0` → **OVERALL: PASS**

theme	image-diff good	image-diff bad (golden-bad)	OCR good	OCR bad	layout good	layout bad
light	0.0000% → PASS	0.7789% → FLAGGED	ALL PRESENT	FLAGGED missing “OTA Manager”	OK	FLAGGED collapsed submit
dark	0.0000% → PASS	1.5193% → FLAGGED	ALL PRESENT	FLAGGED missing “OTA Manager”	OK	FLAGGED collapsed submit

Analyzer self-validation (§11.4.107(10)):

`image_diff_analyzer_sound=true`, `layout_analyzer_sound=true`,
`ocr_analyzer_sound=true` — for both themes.

golden-good image-diff = 0.0000% both themes → **LoginPage pixels UNCHANGED** by the vendoring (the 3 collided tokens kept their HSL values; no component was repointed to OpenDesign tokens in this increment). Per the plan, this means **no golden regeneration was required** — the existing baselines remain valid and the dual oracle re-proves correctness with the OpenDesign layer live in the render (`visual/harness.css` re-imports `../src/index.css`).

Copied baseline PNGs: `baselines/login-light.png`, `baselines/login-dark.png`.

4. Store-writes-DOM unit test — the actual toggle fix (unit-test.log)

`npx vitest run src/stores/ui-store.test.ts` → **Tests 4 passed (4), TEST_EXIT=0.**

Covers (the harness bypasses the store, so this is the only proof of the store wiring): - `setTheme("dark")` → `documentElement.classList` contains dark (not light) + `data-theme="dark"`. - `setTheme("light")` → contains light (not dark) + `data-theme="light"`. - `toggleTheme()` flips DOM class + `data-theme` both directions. - Exactly one of `.light/.dark` present after any change (never both, never neither — the §11.4.170(R6) contract: must ADD `.dark`, not merely remove `.light`).

Regression note (§11.4.6 honesty): the full `npx vitest run` shows 4 pre-existing failing test files (`dashboard.test.tsx`, `features/{deployments,devices,releases}.test.tsx`). Root cause (systematic-debug, §11.4.102): committed feature-page sources import camelCase hook module names (`@/hooks/useDeployments`, `useDevices`, `useReleases`, `useTelemetryOverview`) while the real files are kebab-case (`use-deployments.ts`, ...). **None of those files are in this task's modified set** (`git status` confirms only my 5 files changed) — this is a pre-existing defect unrelated to the vendoring, out of scope for this track. All 17 loadable tests pass, including the 4 new store tests.

5. Toggle bug FIXED — with pixel proof

Chain of captured evidence proving the toggle now changes the **palette**, not just the Sun/Moon icon: 1. **Store writes the DOM** — §4 unit test: `toggleTheme()/setTheme()` write `.light/.dark` + `data-theme` onto `documentElement`. 2. **The class drives the palette** — `src/index.css`: `base :root = DARK palette, .light = LIGHT palette; @custom-variant dark (&:is(.dark *))` activates dark: utilities under `.dark`. 3. **Rendering under `.light` vs `.dark` differs by 98.96% of pixels** — `pixelmatch` of `baselines/login-light.png` vs `baselines/login-dark.png` = **712531 differing pixels (98.96% of 1000×720)** → the palette flips dramatically with the class.

∴ store toggle → DOM class flip → 98.96% palette change. **The pre-fix bug (store mutated state + icon but never wrote the DOM, so the base DARK palette applied permanently) is fixed and pixel-proven.**
