

§11.4.165 CM-INDEPENDENT-VERIFICATION-AGENT functional gate — evidence

Run-id: 20260623-indep-verif-gate · Date: 2026-06-23

What landed

- **Functional gate** CM-INDEPENDENT-VERIFICATION-AGENT added to tests/pre_build_verification.sh (was only the anchor-presence propagation gate before — the functional gate was NOT implemented).
- **Paired §1.1 meta-test** tests/meta/meta_test_independent_verification.sh (auto-globbed into tests/meta/run_all.sh).
- **Standing findings**→**fix marker convention** docs/qa/**/INDEPENDENT_REVIEW.md (this dir's INDEPENDENT_REVIEW.md).

What the gate mechanically asserts

1. **(A) review machinery wired** — tests/meta/lib_metatest.sh present + executable + carries the structurally-separate review SEAM: the fatal restore-integrity abort (MT_RESTORE_FAILED flag + exit 90), so the verifier catches a bluff in itself rather than silently passing.
2. **(B) findings**→**fix marker present** — ≥1 non-empty docs/qa/**/INDEPENDENT_REVIEW.md (the review STEP ran + produced a verifiable artifact, not a rubber stamp).

Honest boundary (§11.4.6)

Does NOT mechanically prove the reviewer was *independent of the author* (a social property enforced by the §11.4.70/§11.4.20 subagent seam, not a grep) nor that the reviewed code is correct (§11.4.108 + §11.4.40 own that). It proves the two things that ARE falsifiable — the gap the propagation gate left open. It is NOT an always-green gate (proven by the paired meta-test below).

Captured evidence (this dir)

- meta_test_independent_verification.run.log — mutate→FAIL→restore→PASS for 3 mutations (strip MT_RESTORE_FAILED, strip exit 90, empty the marker).

- `restore_integrity.txt` — sha256 of `lib_metatest.sh` + marker BEFORE == AFTER (byte-identical restore, no residue §11.4.84).
- `inline_gate_run.log` — the REAL inline gate block run standalone PASSES on the clean tree (not just the meta-test mirror).
- `meta_run_all.log` / `meta_run_all_exit.txt` — full suite **6/6** gates proven bluff-proof (was 5/5, +this gate), exit 0.
- `bash_n.txt` — `bash -n + sh -n clean`.
- `meta_exit.txt` = 0 · `git_status.txt`.
